Ex. No. 11	ADD iOS AS A BUILD TARGET
Date of Exercise	29/09/2026
Git-hub Host Link	https://github.com/rishijayanathaURK23CS1105/flutter_exp11.git

Aim

To configure and build a Flutter application for IOS.

Description

This experiment demonstrates how to configure and test a Flutter application for the iOS platform using the required macOS and Xcode development environment. The Flutter project is created and opened in Xcode through the iOS workspace, where an iOS Simulator or physical device can be selected for testing. The application's UI, navigation, input fields, buttons, images, and screen transitions are verified, followed by building the application for the required iOS distribution target. Through this experiment, students learn the basic process of preparing, testing, and building Flutter applications for iOS.

Procedure

Step 1

Check Flutter:

flutter doctor

Step 2

Check available devices:

flutter devices

Step 3

Create project:

flutter create ios_app

cd ios_app

Step 4

Open the iOS project in Xcode:

open ios/Runner.xcworkspace

Step 5

Select an iOS Simulator in Xcode.

Step 6

Run the application:

flutter run

or run it directly from Xcode.

Step 7 – Test application

Check:

UI

Navigation

Text fields

Buttons

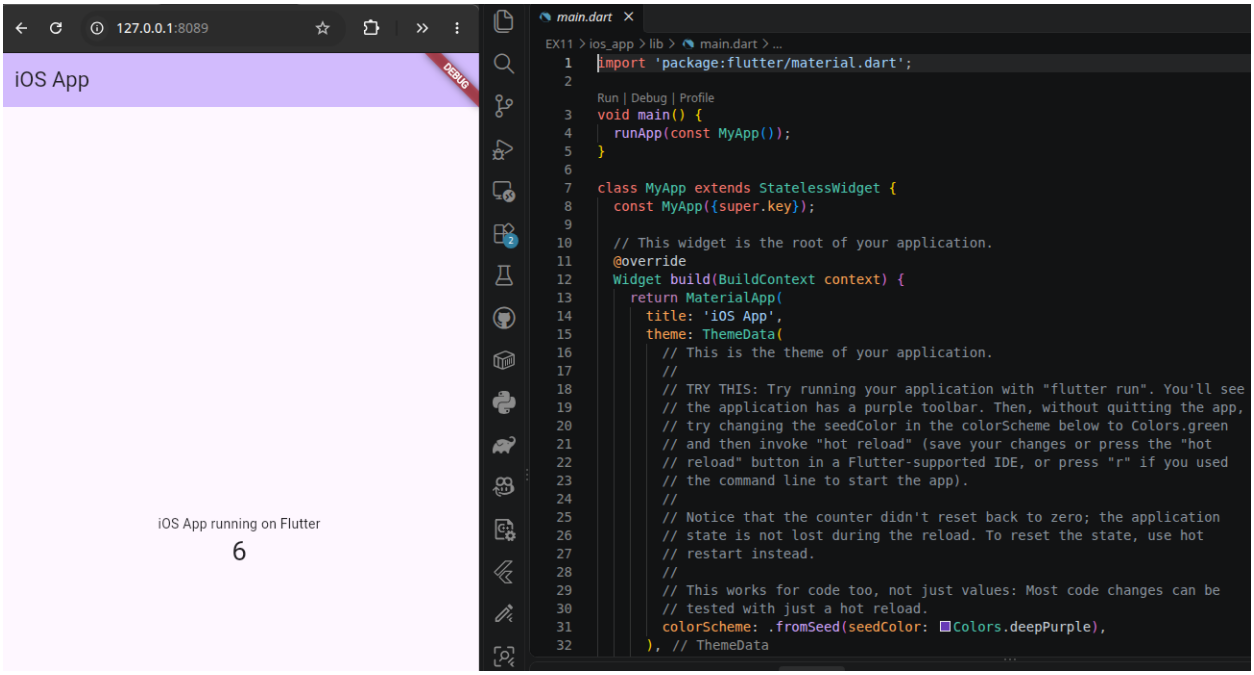

Images

Screen transitions

Step 8 – Build

Use the appropriate Flutter/Xcode build process for the required iOS distribution target.

Output

Result

The experiment successfully created a flutter application that is configured and tested as an iOS application where the required Apple development environment is available.
